

Lecture 11**Dual Spaces, Functionals, and Multilinear Forms**

A linear functional acts as $\varphi(v) = \varphi_i v^i$; the dual basis satisfies $e^i(e_j) = \delta_j^i$. A ★ marks a harder problem.

Dual basis and functionals

Exercise 11.1 (computational) Find the dual basis of $e_1 = (2, 1)$, $e_2 = (1, 1)$ in $\mathbb{F}^2$.

Exercise 11.2 (computational) On $\mathcal{P}_2$, express the functional $\varphi(a + bx + cx^2) = a + c$ in the dual basis of $1, x, x^2$.

Exercise 11.3 (computational) Find the dual basis of $e_1 = (1, 0)$, $e_2 = (1, 1)$ in $\mathbb{F}^2$.

Exercise 11.4 (computational) Find the dual basis of $e_1 = (3, 1)$, $e_2 = (5, 2)$ in $\mathbb{F}^2$.

Exercise 11.5 (computational) On $\mathcal{P}_2$ with basis $1, x, x^2$, expand $\varphi(a + bx + cx^2) = a - b + 2c$ in the dual basis and evaluate φ on $1 + 2x + 3x^2$.

Exercise 11.6 (proof) Prove that for a subspace $U \subseteq V$, $\dim U + \dim U^0 = \dim V$.

Exercise 11.7 (proof) Prove that the dual basis $e^1, \dots, e^n$ is linearly independent in V^* .

The dual map

Exercise 11.8 (computational) Let $T: \mathbb{F}^2 \rightarrow \mathbb{F}^2$ have matrix $\begin{pmatrix} 2 & 1 \\ 0 & 3 \end{pmatrix}$. Compute $\mathcal{M}(T')$ in the dual bases.

Exercise 11.9 (computational) Let $T: \mathbb{F}^2 \rightarrow \mathbb{F}^2$ have matrix $\begin{pmatrix} 1 & 2 \\ 3 & 4 \end{pmatrix}$. Compute $\mathcal{M}(T')$ in the dual bases.

Exercise 11.10 (computational) Let $T: \mathbb{F}^3 \rightarrow \mathbb{F}^2$ have matrix $\begin{pmatrix} 1 & 2 & 0 \\ 0 & 1 & 3 \end{pmatrix}$. Write $\mathcal{M}(T')$ and state the domain and codomain of T' .

Exercise 11.11 (computational) Let $T: \mathbb{F}^2 \rightarrow \mathbb{F}^2$ have matrix $\begin{pmatrix} 2 & 0 \\ 1 & 3 \end{pmatrix}$. For $\varphi = 2e^1 - e^2$ compute $T'\varphi$ in the dual basis.

Exercise 11.12 (proof) Prove that $(ST)' = T'S'$ for $T: U \rightarrow V$, $S: V \rightarrow W$.

Exercise 11.13 (proof) Prove $\text{null } T' = (\text{range } T)^0$.

Exercise 11.14 (proof) Prove that $(S + T)' = S' + T'$ for $S, T: V \rightarrow W$.

Bilinear and multilinear forms

Exercise 11.15 (computational) Write the matrix of $B(u, v) = 2u_1v_1 - u_1v_2 + 3u_2v_2$, and split it into symmetric and antisymmetric parts.

Exercise 11.16 (computational) For B with matrix $\begin{pmatrix} 1 & 2 \\ 3 & 1 \end{pmatrix}$, $u = (1, 1)$ and $v = (2, -1)$, compute $B(u, v) = u^T B v$.

Exercise 11.17 (computational) Write the matrix of $B(u, v) = u_1v_1 + 4u_1v_2 + 2u_2v_1 - u_2v_2$ and split it into symmetric and antisymmetric parts.

Exercise 11.18 (computational) Write the matrix of the symmetric bilinear form on $\mathbb{R}^2$ whose quadratic form is $Q(v) = v_1^2 + 4v_2^2 + 2v_1v_2$.

Exercise 11.19 (proof) Let $f: (\mathbb{F}^n)^n \rightarrow \mathbb{F}$ be multilinear in its n column arguments and suppose f vanishes whenever two columns are equal. Prove that f is then *alternating*: swapping two columns changes the sign. (The determinant is such an f , so this shows column swaps flip its sign.)

Exercise 11.20 (proof) Prove that every bilinear form B on V splits uniquely as $B = S + A$ with S symmetric and A alternating.

Covariant and contravariant

Exercise 11.21 (computational) In a basis with metric $g_{ij} = \begin{pmatrix} 2 & 0 \\ 0 & 3 \end{pmatrix}$, lower the index of the vector with contravariant components $v^i = (1, 2)$, and compute $\langle v, v \rangle$.

Exercise 11.22 (computational) With metric $g_{ij} = \begin{pmatrix} 1 & 0 \\ 0 & 4 \end{pmatrix}$, lower the index of $v^i = (2, 1)$ and compute $\langle v, v \rangle$.

Exercise 11.23 (computational) With metric $g_{ij} = \begin{pmatrix} 1 & 1 \\ 1 & 2 \end{pmatrix}$, lower the index of $v^i = (1, 2)$ and compute $\langle v, v \rangle$.

Exercise 11.24 (computational) The metric $g_{ij} = \begin{pmatrix} 1 & 1 \\ 1 & 2 \end{pmatrix}$ has inverse $g^{ij} = \begin{pmatrix} 2 & -1 \\ -1 & 1 \end{pmatrix}$. Raise the index of the covector $\varphi_i = (1, 3)$.

Exercise 11.25 (computational) With the Minkowski metric $g_{\mu\nu} = \text{diag}(1, -1, -1, -1)$ and $x^\mu = (2, 1, 0, 3)$, find x_μ and the interval $x_\mu x^\mu$.

Exercise 11.26 (★) Show that the canonical map $V \rightarrow V^{**}$, $v \mapsto (\varphi \mapsto \varphi(v))$, is injective (hence an isomorphism in finite dimensions).
